b. A brief description of why you picked this design to implement (~1 paragraph)

- Resizing - Our team chose a design that allows users to view a video and a note in four different ways. Each resizing option shows the ratio of a video and a note. This design makes users select the option they want.
- Code block - Creating the code block rather than wrapping the code part with the `<code>` tag which is described in the Secondary Interface is more straightforward because it directly shows the rendered result for the user and the written code becomes more recognizable. Therefore, users can organize better-looking notepads through this.
- Font styling - Our team chose the toolbar based font-styling because it is the most common design for the font styling function such as MS words. We believe that most users who have ever used any documentation program like MS words are already familiar with this way of styling the fonts. Thus, users can easily recognize and use the functions without any extra tutorials.

c. If you did user testing for this assignment, briefly describe:

We recruited junior and senior students majoring in Computer Science in SUNY Korea. We performed the test in a lab and CS lounge, and each test took approximately 5 minutes. We focused on how the tester accomplishes each task without extra explanation.

- Video Resizing - One of our testers mentioned that it would have been better if there is a undo option for video resizing so that the user does not have to click several times to go back to the previous screen.
- Code Block - Some testers suggest the toggling function for the code block and make the code block as a sticky note.
- Font styling - Some testers asked us to create the alignment function for the note section and bullet points like how we can do it in MS word.

d. A bulleted list of any changes you would like to make for your actual implementation of the website/application.

- Paragraph alignment
- Bullets and Numbering

e. Your notes from the in-class activity on April 29.

One feedback from the in-class activity with another team is that a dragging option to resize the screen would be useful. Since YouNote prototype only provides 4 different types of

fixed video and notepad styles, testers expressed their opinion about controlling size of video by themselves.
